

# APPLE POLLINATION

- An apple variety can generally be pollinated by any other variety **in the same column or in an adjacent column.**
- Apples marked with an 'S' are partially self-fertile varieties that will often produce enough fruit for the home gardener. A second tree to enhance pollination will increase production.
- Sterile pollen varieties are marked with a "T" for triploid. Sterile varieties must be pollinated by a variety that is not sterile. They cannot pollinate another variety, so it is best to choose a self-fertile variety for pollination.
- Crabapples can also pollinate apples as long as they bloom at the same time. Information on four varieties has been provided.

EARLY	EARLY - MID	MID - LATE	LATE
Amere de Berthecourt	<b>Ashmead's Kernal</b>	Akane - S	<b>Fuji</b>
Chehalis - S	<b>Cortland</b>	Arkansas Black - T	<b>Granny Smith-S</b>
